# Exit ticket

The lines that refine a QuerySet are every filter(), order_by(), [:10], and values(), because each one returns a new QuerySet and does not hit the database, it only builds the query.

The action that evaluates it is list(), because it runs the query on the database and returns the results.

```
6 [<Product: Product object (4)>]
>>>
>>> qs = qs[:10]
>>> print(7, list(qs))
7 [<Product: Product object (4)>]
>>>
>>> result = qs.values("name", "sku", "price")
Traceback (most recent call last):
  File "<console>", line 1, in <module>
AttributeError: 'list' object has no attribute 'values'
>>> print(8, list(result))
